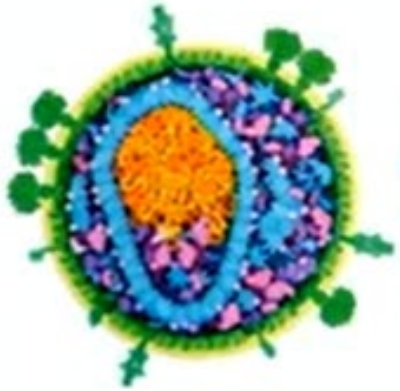
RISKS OF METABOLIC SYNDROME, DIABETES, AND CARDIOVASCULAR DISEASE IN ADVANCE TRIAL

Andrew Hill

University of Liverpool
Liverpool, United Kingdom



CROI
Conference on Retroviruses and Opportunistic Infections

Predicted 10-year risks of diabetes and cardiovascular disease in the ADVANCE trial

Andrew Hill[1], Kaitlyn McCann[2], Ambar Qavi[2], Bryony Simmons[2] ,Victoria Pilkington[2], Michelle Moorhouse[3], Godspower Akopmiemie[3], , Simiso Sokhela[3], Celicia Serenata[3], Alinda Vos[4], Francois Venter[3]

[1] Liverpool University, Pharmacology, Liverpool, United Kingdom, [2] Imperial College London, Faculty of Medicine, Lond
[3] Ezintsha, Wits Reproductive Health and HIV Institute, Johannesburg, South Africa; [4] University Medical Center Utrecht, I
Netherlands

Potential risks from clinical obesity (BMI >30)

Type II diabetes

Cardiovascular disease: myocardial infarction / death

Alzheimer's disease

Obstetrics / birth outcomes: Gestational diabetes, pre-eclampsia, venous thromboembolism, maternal death, birth defects

Cancer

Reductions in life expectancy

Research questions

In the ADVANCE trial of treatment naïve patients in South Africa:

1. What changes are seen in markers of cardiovascular risk and diabetes?

2. Can we use risk equations to predict the risk of cardiovascular disease or diabetes from these changes?

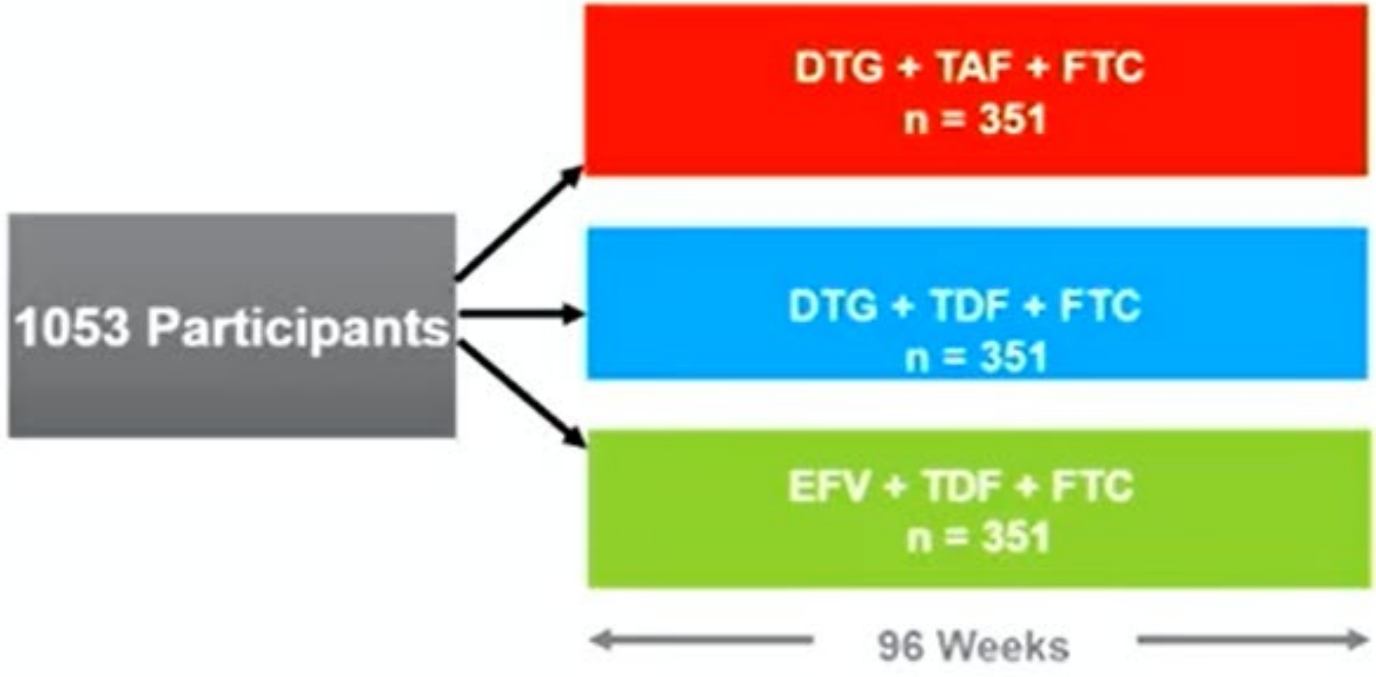
Non-parametric tests used throughout analysis, given strong positive skew. Results repeated using log10 transformation and parametrics, with similar results

Bonferroni corrections used to adjust for multiple testing (p=0.017, th
comparisons).

ADVANCE study: Trial design

Inclusion criteria:

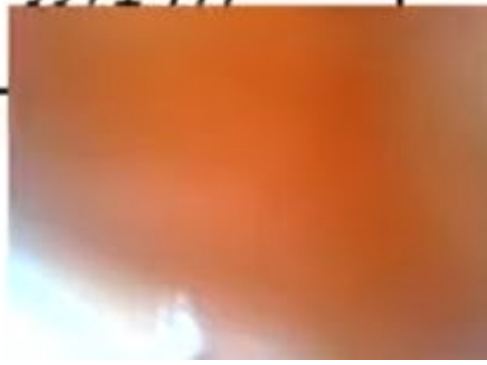
- Treatment-naïve, HIV-1 RNA level >500 copies/mL in the last 60 days



Open-label, 96-week study in Johannesburg, South Africa
Study visits at Baseline, Week 4, 12, 24, 36, 48, 60, 72, 84 and 96

Baseline characteristics (1/2)

Characteristic	TAF/FTC+DTG (n=351)	TDF/FTC+DTG (n=351)	TDF/FTC/EFV (n=351)
Age, mean (SD), years	33 ± 8	32 ± 8	32 ± 7
Female	61%	59%	57%
Black	99%	100%	100%
Baseline HIV-1 RNA			
≤100,000 copies/mL	78%	80%	77%
>100,000 copies/mL	22%	20%	23%
CD4+ cell count, mean (SD), cells/mm^3	349 ± 225	323 ± 234	337 ± 222

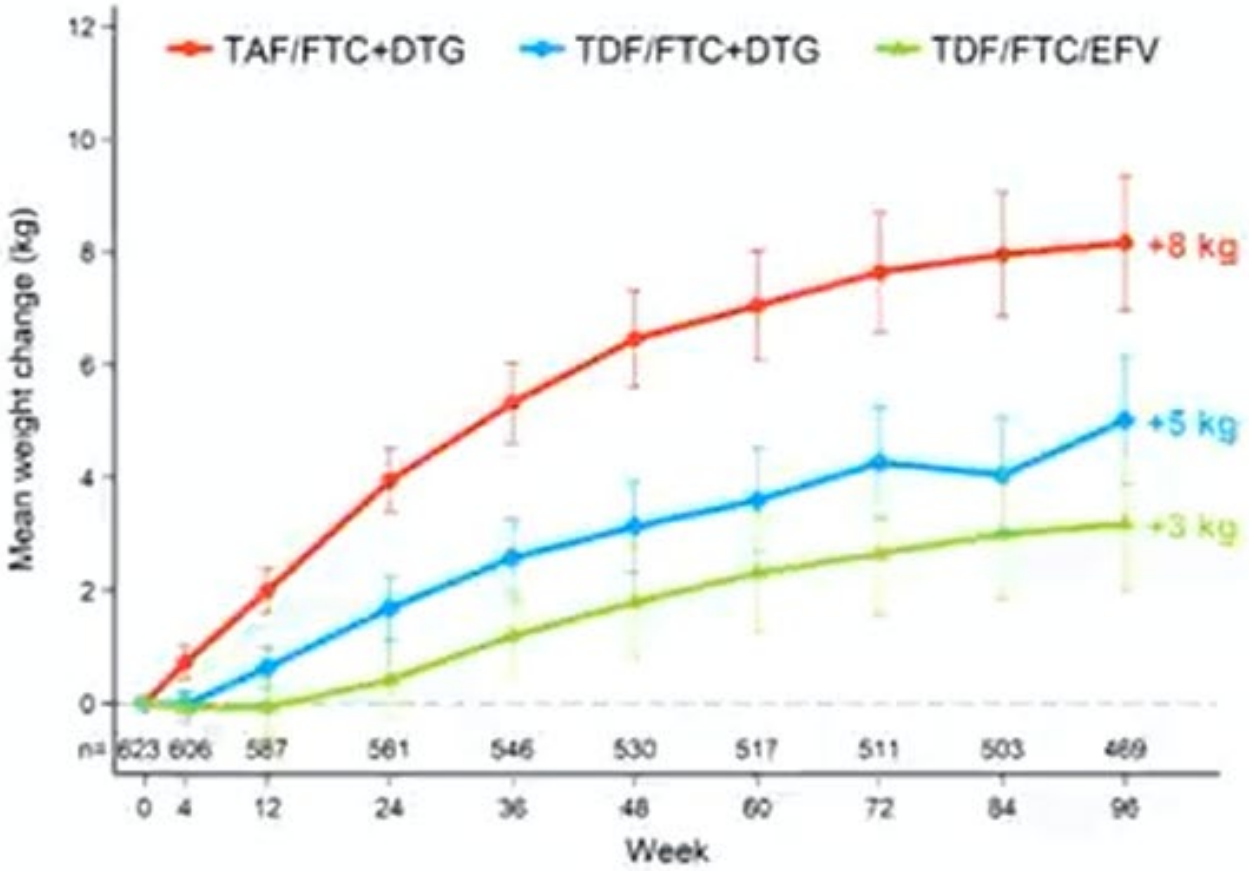


Baseline characteristics (2/2)

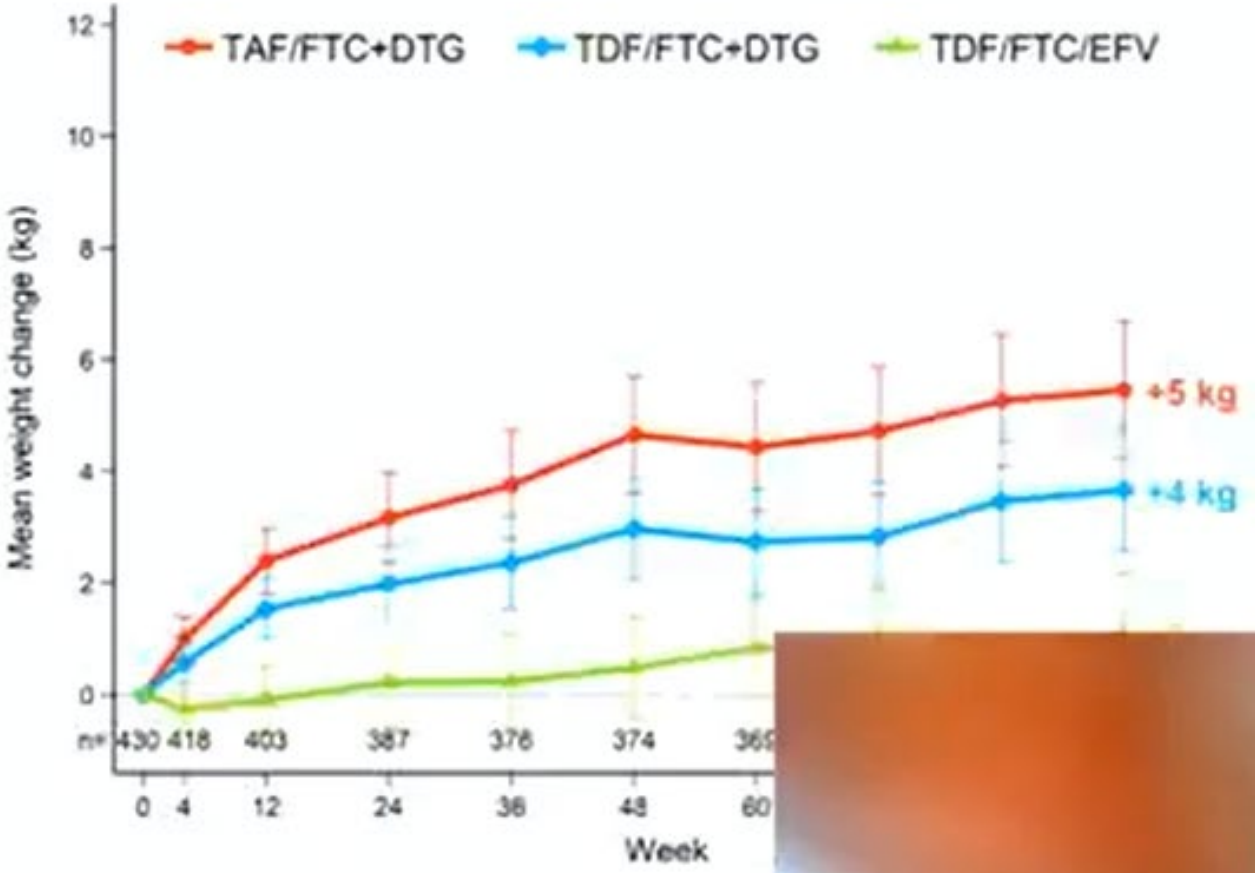
Characteristic	TAF/FTC+DTG (n=351)	TDF/FTC+DTG (n=351)	TDF/FTC/EFV (n=351)
Weight, mean (kg)			
Male	67.9	67.1	67.3
Female	68.8	69.5	70.2
BMI, mean (kg/m²)			
Male	21.7	21.6	21.8
Female	25.6	26.1	26.1
Categories of BMI, n (%)			
Underweight (< 18.5)	42 (12%)	35 (10%)	37 (11%)
Normal (18.5-25)	177 (51%)	190 (54%)	
Overweight (25-30)	96 (27%)	78 (22%)	
Obese (> 30)	35 (10%)	48 (14%)	

Mean change in weight (kg) to Week 96

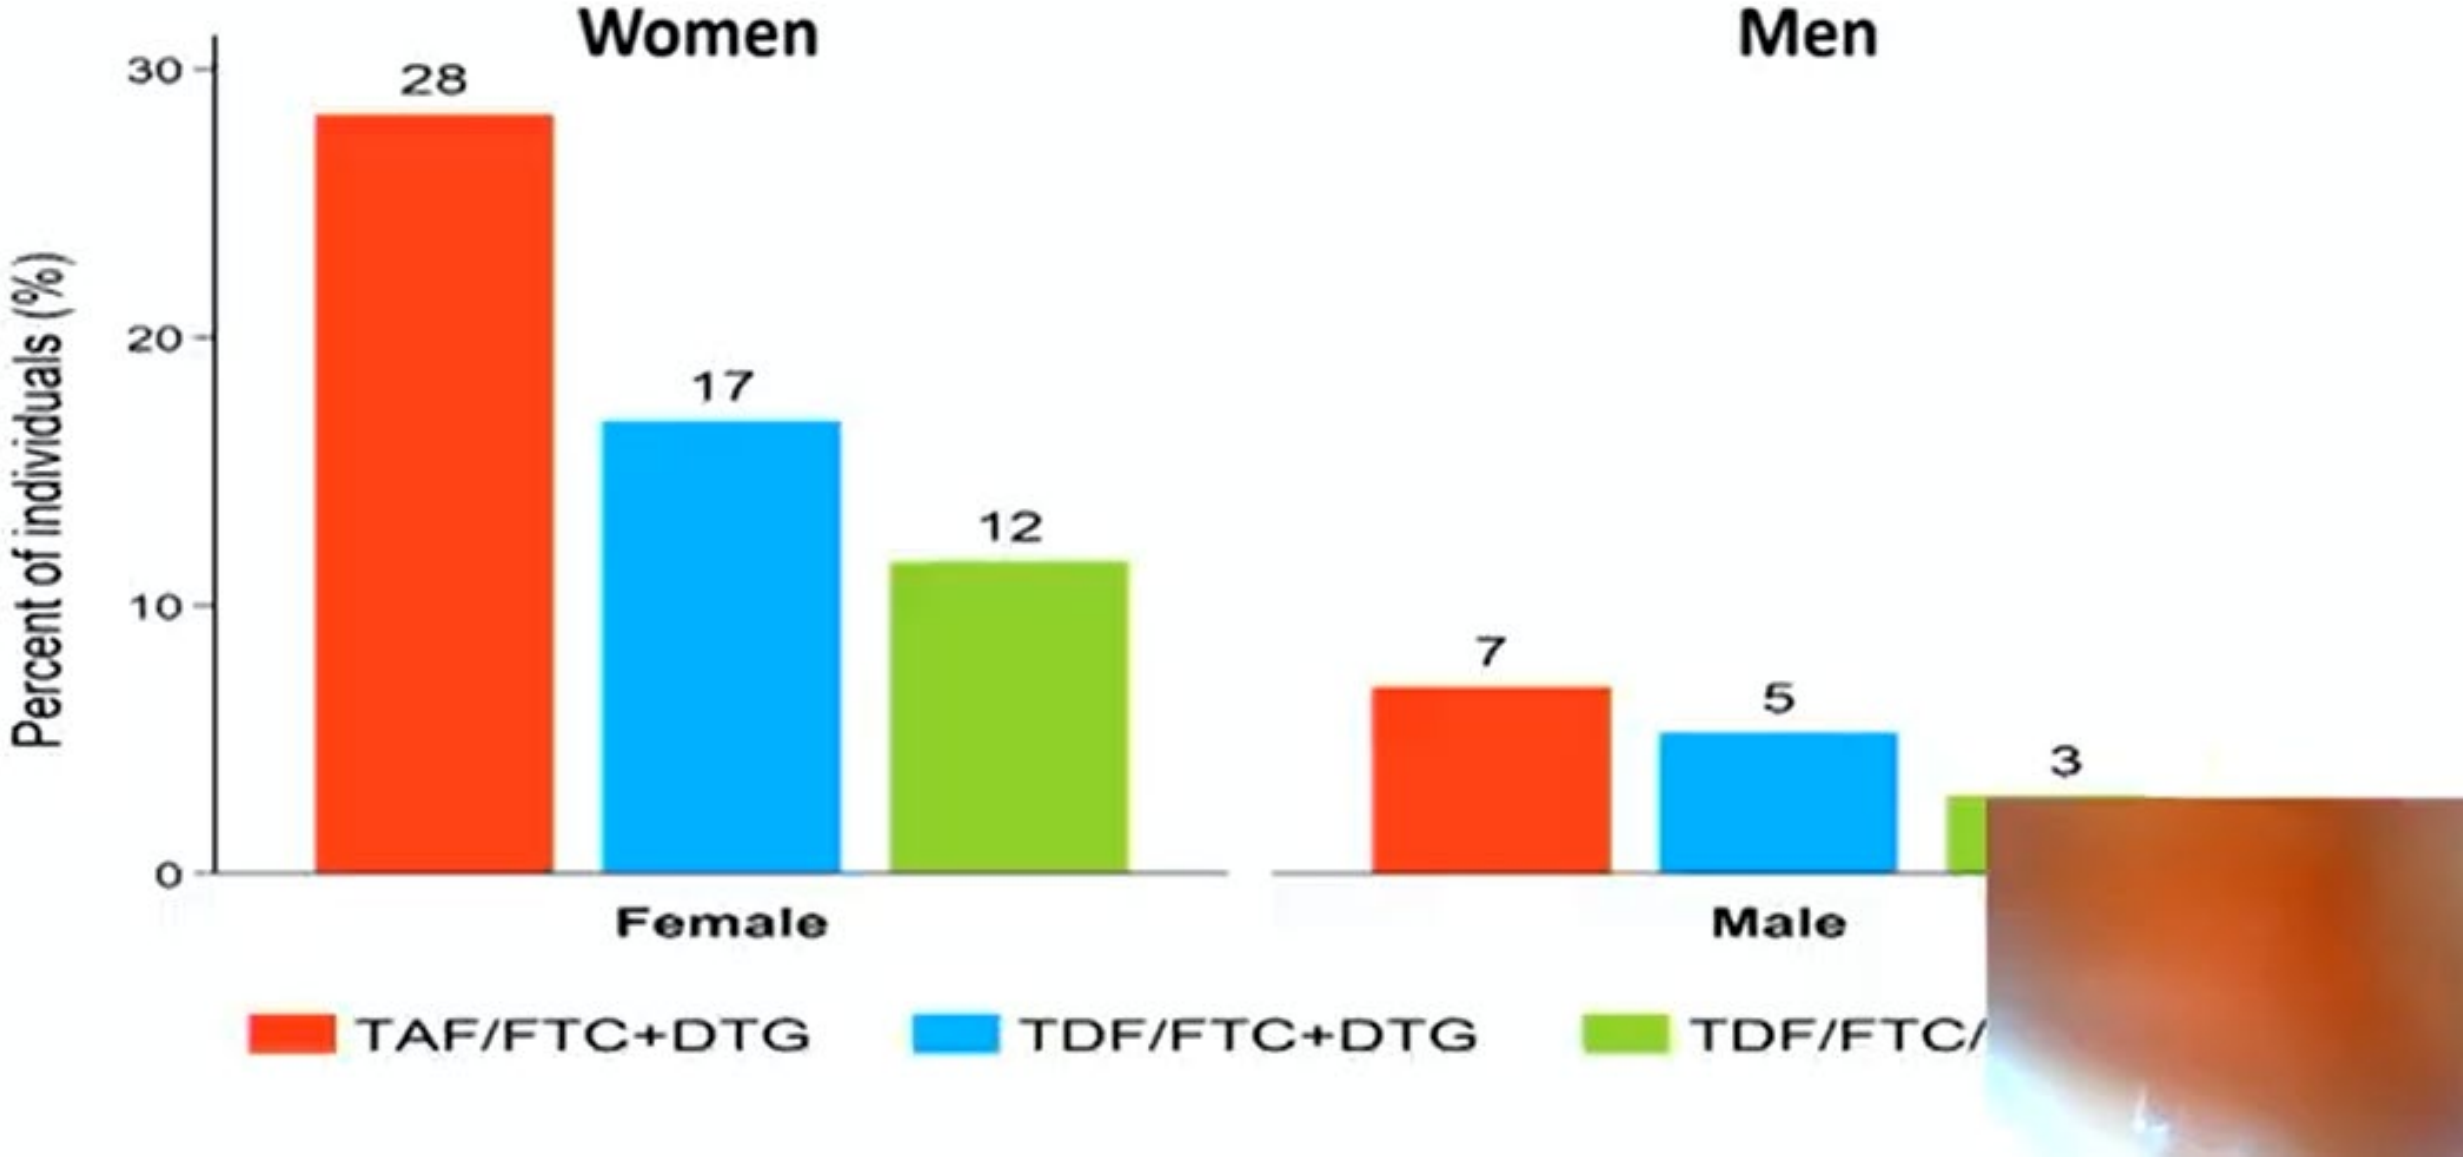
Women



Men



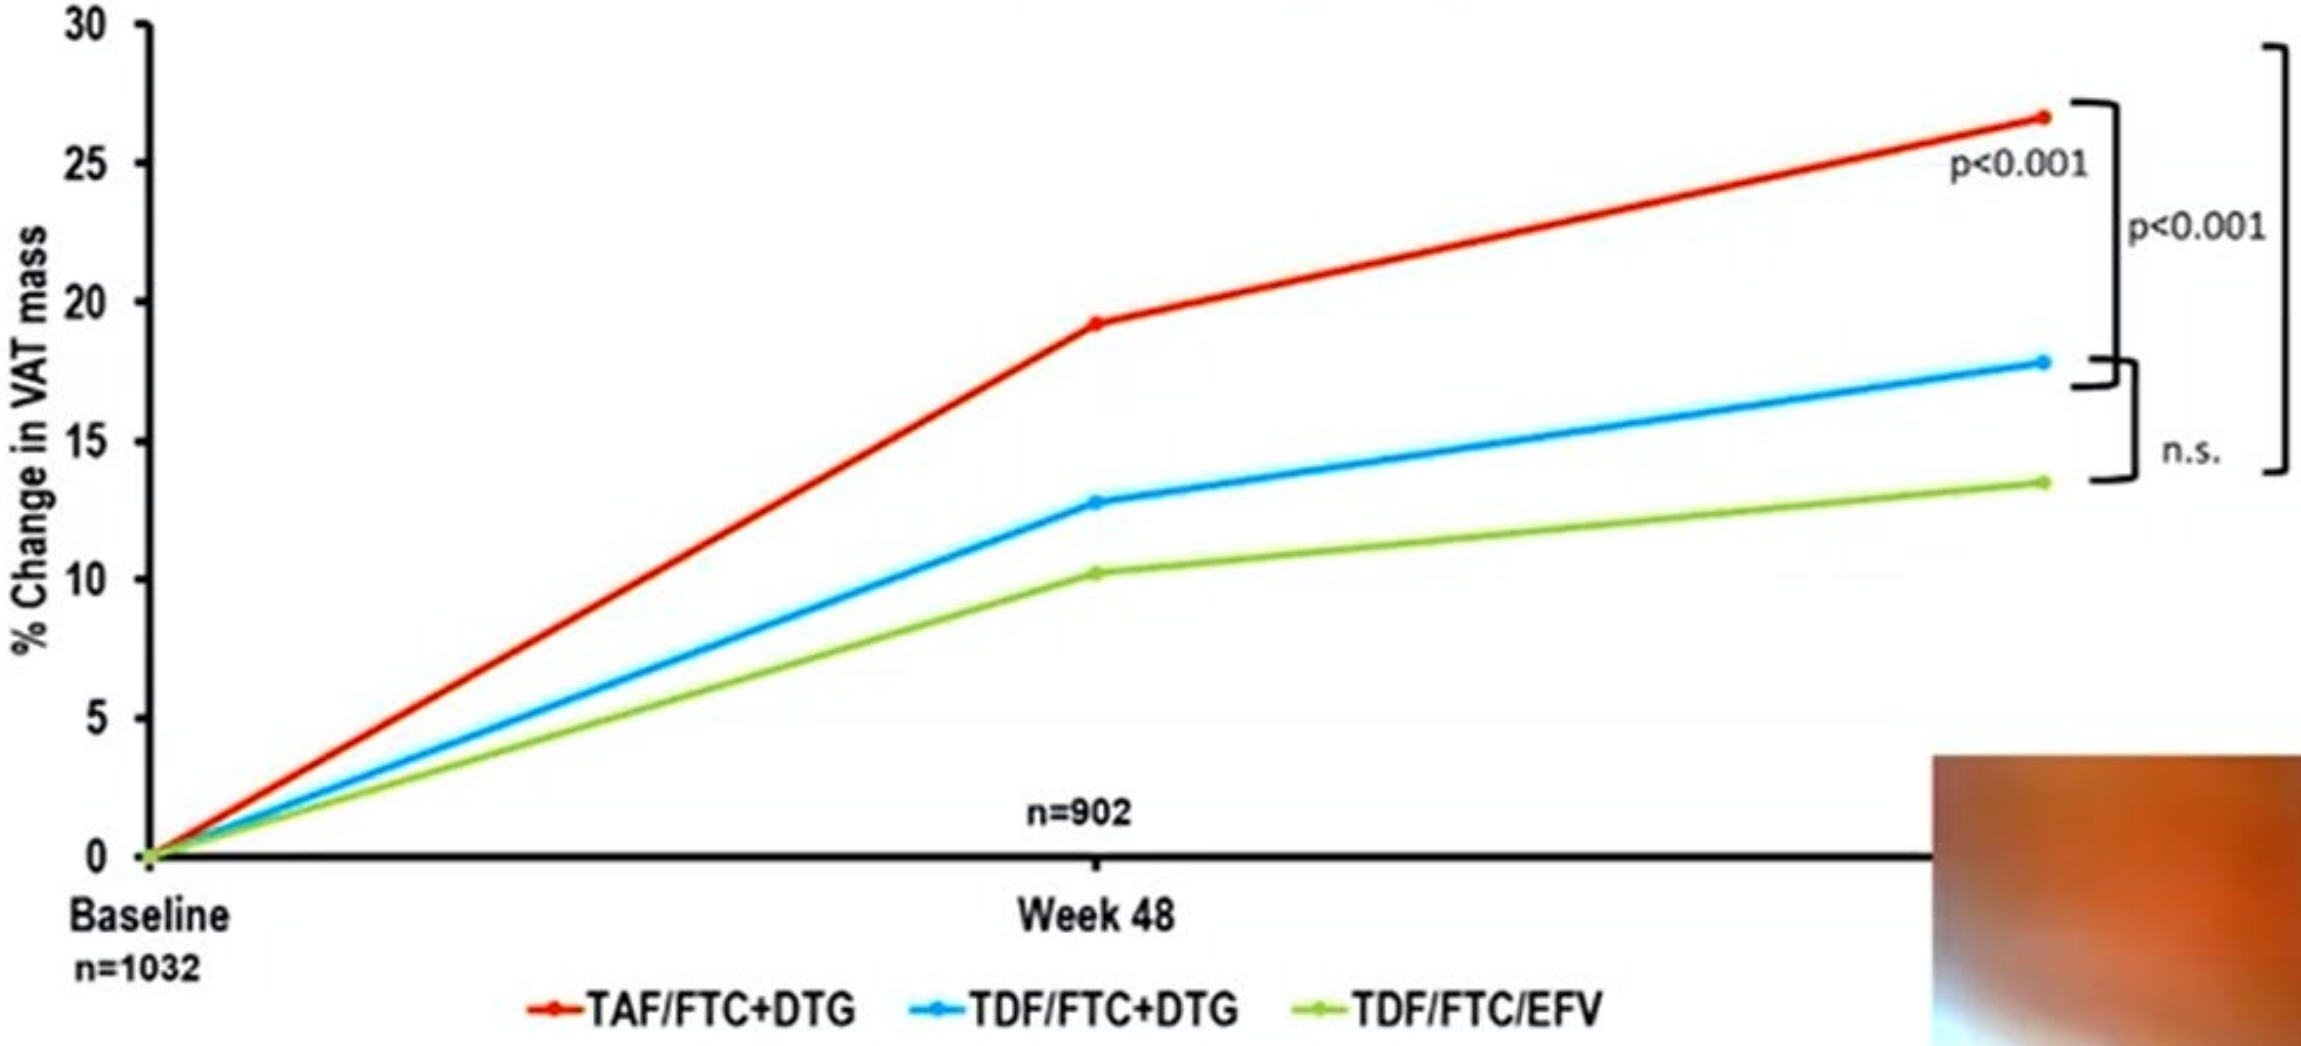
Treatment-emergent obesity to Week 96



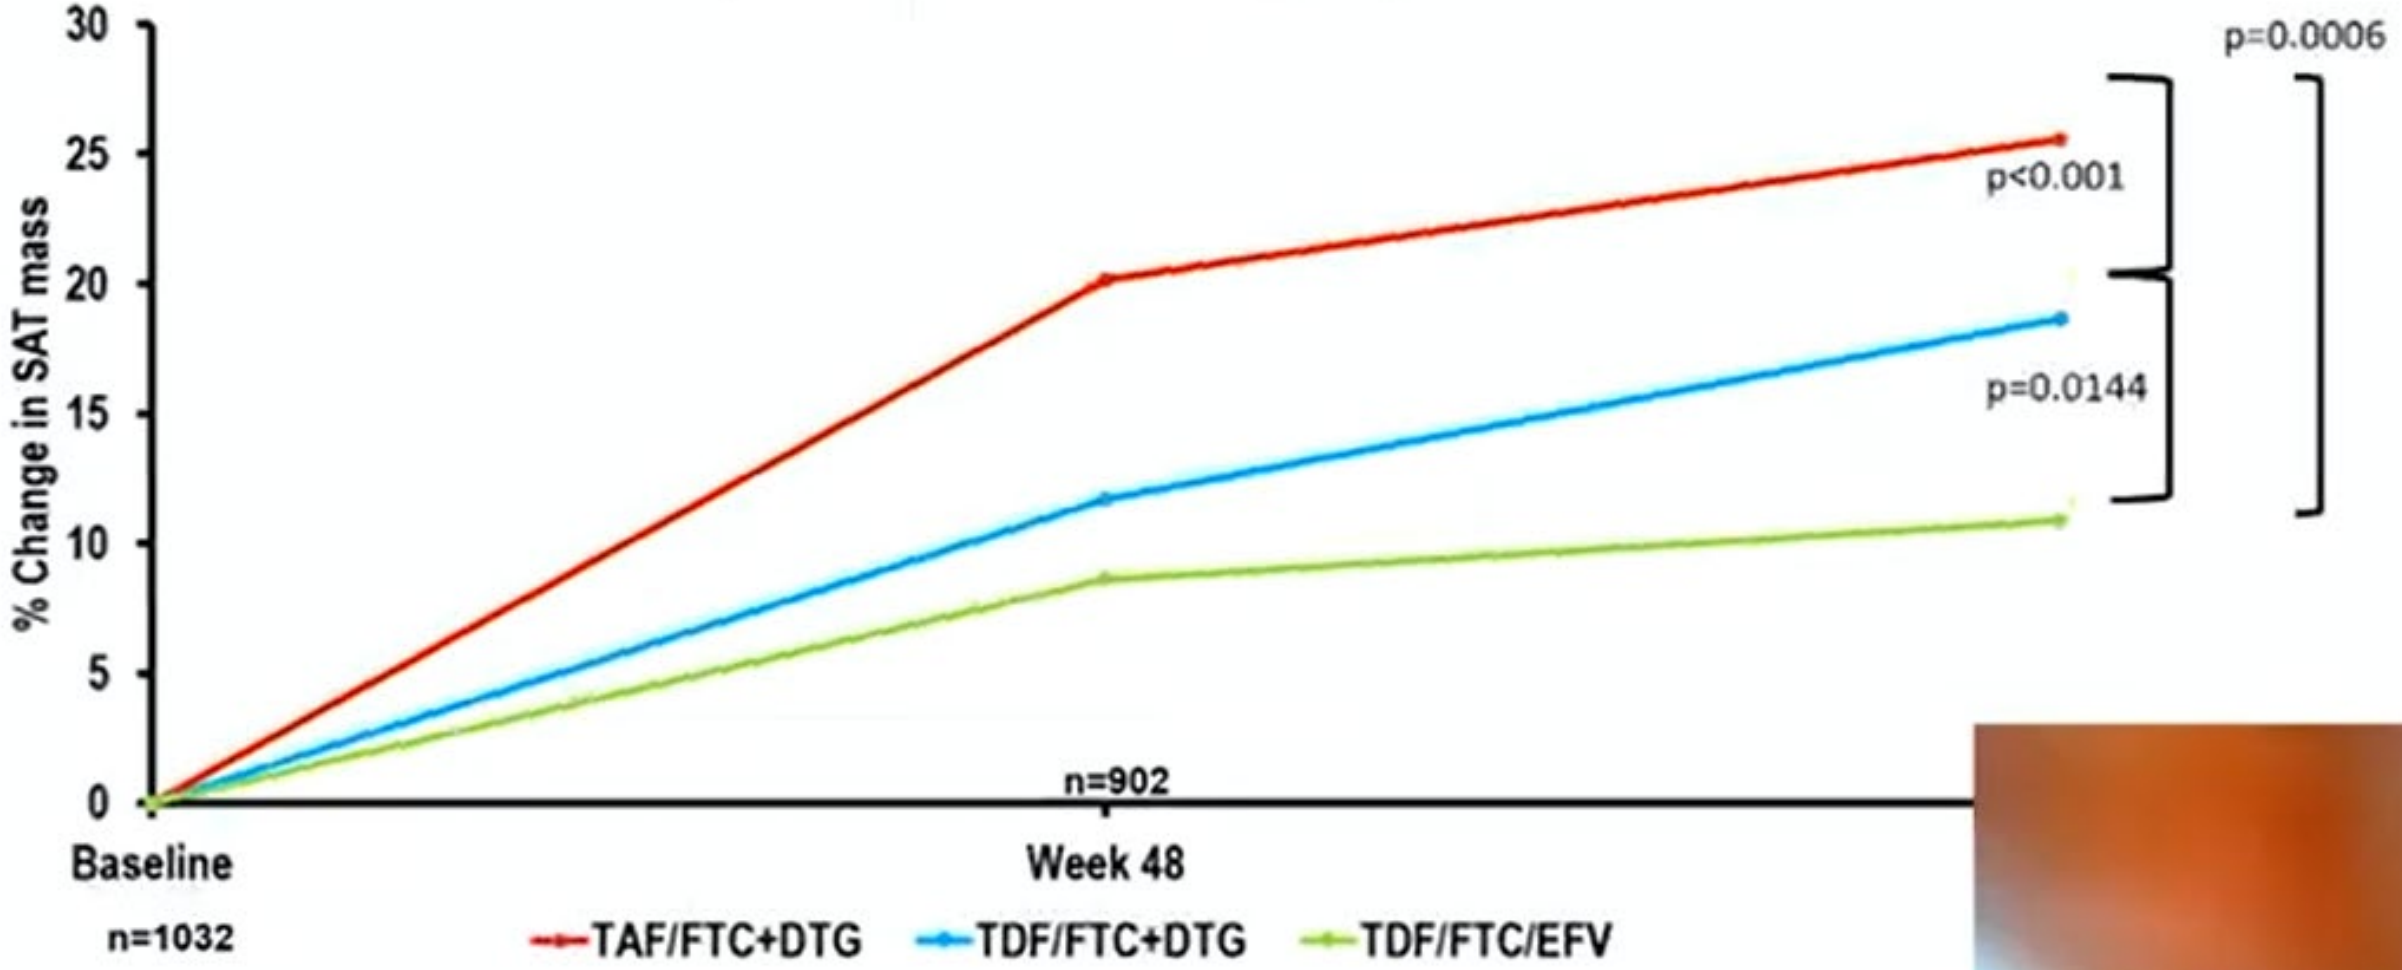
Changes in Lab parameters to week 96, median (IQR)

	TAF/FTC+DTG (n=185)	TDF/FTC+DTG (n=187)	TDF/FTC/EFV (n=191)			
Week 96				Group 1 vs. 3	Group 1 vs. 2	Group 2 vs. 3
Total cholesterol (mg/dL)	10.4 (-5.4, 24.0)	1.5 (-13.1, 19.7)	13.1 (-1.9,33.3)	P=0.022	p=0.007	p<0.001
LDL (mg/dL)	8.5 (-6.2, 20.5)	2.3 (-10.8, 12.4)	6.2 (-5.0 , 22.0)	p=0.82	p=0.007	P=0.013
HDL (mg/dL)	4.6 (-2.3, 12.0)	3.9 (-2.3, 12.0)	9.7 (2.3, 19.3)	p<0.001	p=0.73	p<0.001
Fasting glucose (mg/dL)	19.3 (7.7, 34.8)	19.3 (0.00, 34.8)	27.1 (11.6, 42.5)	0.0049	p=0.21	p<0.001
Systolic BP (mmHg)	3.0 (-7.0,11.0)	-1.0 (-12.0,8.0)	0.50(-9.0 8.0)	p=0.19		

Median % change in Visceral Adipose Tissue (VAT) from baseline to week 96 (DXA)



Median % change in Subcutaneous Adipose Tissue (SAT) to week 96 (DXA)



Metabolic syndrome: Definition

Assessed using the International Diabetes Federation (IDF) definition:

- **Clinical obesity (BMI > 30 kg/m^2)**
- **AND** any two of the following factors

Raised triglycerides	≥ 150 mg/dL (1.7 mmol/L) *OR* on treatment for this lipid abnormality
Reduced HDL cholesterol	Males: ≤ 40 mg/dL (1.03 mmol/L) Females: ≤ 50 mg/dL (1.29 mmol/L) *OR* on treatment for this lipid abnormality
Raised blood pressure	Systolic BP ≥ 130 mmHg Diastolic BP ≥ 85 mmHg *OR* on treatment for previously diagnosed hypertension
Raised fasting glucose	≥ 100 mg/dL (5.6 mmol/L) *OR* diagnosis of Type 2 diabetes

Metabolic syndrome at Week 96

	TAF/FTC+DTG	TDF/FTC+DTG	TDF/FTC/EFV
Baseline prevalence	16/351 (5%)	21/351 (6%)	14/351 (4%)
Treatment-emergent metabolic syndrome			
Week 96	20/259 (8%)	15/258 (6%)	8/242 (3%)

Statistically significant differences between TAF/FTC+DTG and TDF/F
at Week 96 (p=0.031).

Framingham Risk Equation

Estimates 10-year risk of myocardial infarction or coronary death

https://reference.medscape.com/calculator/framingham-cardiovascular-disease-risk

Variables included in equation:

- Age
- Sex
- Systolic BP
- Total cholesterol
- HDL cholesterol
- On hypertension medication
- Smoking status
- Diabetes

Framingham Risk Equation results

Predicted results over time:

Treatment arm / 10-year risk	Baseline	Median change to: Wk 48	Wk 96
TAF/FTC+DTG:	2.37%	0.00%	+0.43%
TDF/FTC+DTG:	2.53%	-0.06%	+0.22%
TDF/FTC/EFV:	2.24%	-0.08%	+0.28%

No significant differences between arms at Week 96

QRISK Equation

Estimates 10-year risk of developing a heart attack or stroke

https://qrisk.org/three/

Variables included in equation

- Age (25-84)
- Sex
- Ethnicity (Black African included)
- Cholesterol ratio
- Systolic BP
- BMI
- Family history of heart attack/angina*
- Smoking status
- Diabetes
- Chronic kidney disease (stages 3,4, or 5)
- Atrial fibrillation
- Migraines
- Rheumatoid arthritis
- Systemic lupus erythematous (SLE)
- Severe mental illness (schizophrenia, bipolar disorder, moderate/severe depression
- On treatment for hypertension
- On atypical antipsychotic med
- On regular steroid tablets
- Erectile disfunction

*information not available

QRisk Equation results:

Predicted results over time:

Treatment arm / 10-year risk	Baseline	Median change to:	
		Wk 48	Wk 96
TAF/FTC+DTG:	0.60%	+0.10%	+0.20%
TDF/FTC+DTG:	0.60%	+0.10%	+0.20%
TDF/FTC/EFV:	0.50%	0.00%	+0.10%

Borderline significant differences between TAF/FTC+DTG and TDF/FTC/EFV at week 96 (p=0.027)

QDIABETES Equation

Website / reference: https://qdiabetes.org/

Estimates the 10-year risk of developing diabetes

Variables included in equation:

- Age (25-84)
- Sex
- Ethnicity (Black African included)
- Fasting blood glucose
- HBA1c*
- BMI
- Smoking status
- Family history of diabetes*
- On treatment for hypertension
- Heart attack/angina/stroke/TIA
- Learning disabilities
- Manic depression/schizophrenia
- On regular steroid tablets
- On statins
- On atypical antipsychotic medication
- Polycystic ovaries
- Gestational diabetes

*information not available

QDIABETES Equation results:

Predicted results over time:

Treatment arm / 10-year risk	Baseline	Median change to: Wk 48	Wk 96
TAF/FTC+DTG:	0.30%	+0.70%*	+0.90%*
TDF/FTC+DTG:	0.40%	+0.40%	+0.50%
TDF/FTC/EFV:	0.30%	+0.60%**	+0.70%**

*TAF/FTC+DTG risk significantly higher than TDF/FTC+DTG at Week 48 (p=0.008) and Week 96 (p=0.004)

**TDF/FTC/EFV risk significantly higher than TDF/FTC+DTG at Week 48 (p=0.0
96 (p=0.005)

No significant differences between TAF/FTC/DTG and TDF/FTC/EFV at Weeks

Limitations of the current analysis

- The ADVANCE population is young (median 31 years), when the risk of MI and diabetes is relatively low.
- Among women treated with TAF/FTC+DTG, weight is continuing to rise to Week 96, with no sign of a plateau. The predictive models do not account for additional weight gain after week 96.
- ADVANCE is in treatment naïve patients; increases in weight could be partly a "return to health" effect. However this does not explain the higher weight gains for TAF/FTC/DTG versus TDF/FTC/DTG.
- Other NCDs need to be evaluate: Cancer, Alzheimer's, adverse birth outcon

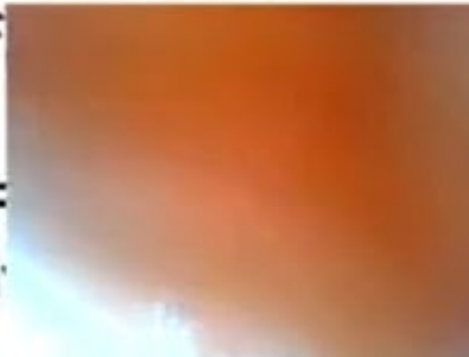
Conclusions

In the ADVANCE Trial, TAF/FTC+DTG was associated with a significantly higher risk of:

- Clinical obesity
- Metabolic syndrome
- Rises in VAT and SAT
- Predicted risk of diabetes

The predicted risk of MI from these changes is not significant. However, there is a predicted increase in the risk of diabetes – 4 cases per 1000 people treated with TAF/FTC+DTG versus TDF/FTC+DTG. Additional risks for TDF/FTC/EF

These analyses should be repeated for other studies evaluating TAF/F
integrase inhibitors in other patient populations and lines of treatmen



WHO – first-line treatment guidelines

Preferred	Alternative	Special Circumstances only
TDF/XTC/DTG	TDF/XTC/EFV400	TDF/XTC/EFV600 ZDV/3TC/EFV600 TDF/3TC/PI/r TDF/3TC/RAL **TAF/3TC/DTG*** ABC/XTC/DTG

***TAF may be considered for patients with established osteoporosi and/or impaired renal function**
